

GlassBox

Transparent AI Security Platform

Your security platforms already make millions of critical decisions every day. GlassBox gives you complete visibility into every single one — so your SOC analysts understand exactly why an action was taken, your compliance team has perfect audit trails, and your models adapt automatically when threats change. No more black-box guesswork.

Enterprise Security Overview · March 2026

Designed for Okta, Cloudflare, CrowdStrike, Palo Alto Networks, SentinelOne and beyond

1. The Challenge: Why Traditional Security AI Creates Risk

Modern cybersecurity platforms rely on AI to block logins, classify traffic, and isolate endpoints. These systems are fast and accurate on normal activity — but they hide their reasoning. When something goes wrong, your team is left asking “why?”.

Three real-world problems follow:

Problem	What It Means for Your Team	Business Impact
Unexplained decisions	SOC analysts see only a risk score	Alert fatigue, delayed triage, and lost trust in the system
Slow adaptation to new attacks	Attackers evolve faster than your models can retrain	Detection gaps that last days or weeks
Compliance & audit pressure	You must prove every automated decision	Manual evidence gathering, long audit cycles, and regulatory risk

GlassBox was built to solve these exact problems — giving you transparent, adaptive, and compliance-ready AI that works inside your existing tools.

2. How GlassBox Delivers Transparent Security

GlassBox breaks every decision into clear signals you define yourself. It then shows you exactly which signals drove the outcome and automatically learns from real incidents to stay ahead of new threats. The result is security you can trust, explain, and prove.

Precise Signal Attribution

Every decision is decomposed into the exact signals that mattered — so your analysts instantly see why a login was blocked or why traffic was flagged. No more guessing.

Cross-Signal Intelligence

GlassBox automatically detects dangerous combinations of signals that individually look normal. This catches sophisticated attacks that single-signal tools miss.

Automatic Adaptation

When your environment changes or new attack patterns appear, GlassBox learns directly from the incidents and strengthens your models — without manual retraining or extra labels.

Flexible Signal Design

You choose how many signals to use. Keep it simple for fast triage or go deeper for forensic detail. GlassBox adapts to whatever level your team needs.

Your SOC gets clear explanations. Your compliance team gets perfect audit evidence. Your security improves automatically. All without changing how you work today.

3. Okta – Stronger Identity & Access Protection

Okta handles billions of authentication events every day. The biggest challenge is that risk scores alone don't tell you why a login was blocked or allowed. Analysts waste time investigating, and compliance teams struggle to prove decisions.

How GlassBox helps

Signal Group	What It Detects
Geospatial	Impossible travel, malicious networks, proxy/VPN use
Device	Spoofed devices, malware fingerprints, headless browsers
Behavioural	Credential stuffing, session hijacking, unusual typing patterns
Temporal	Off-hours access, burst attempts, abnormal timing
Contextual	Privilege escalation, access to sensitive resources

When a login is blocked, your analyst receives an exact, easy-to-read breakdown showing which signals drove the decision. The dominant signal is highlighted so you can act immediately. Every explanation is 100% reproducible — perfect for audits.

If attackers evolve their tactics, GlassBox automatically learns from the missed or false-positive events and updates your model — keeping your identity protection current without extra work.

4. Cloudflare – Network Security & Zero Trust

Cloudflare protects 20% of global web traffic. The challenge is separating legitimate traffic from sophisticated bots and DDoS attacks — especially when individual signals look normal.

How GlassBox helps

Signal Group	What It Detects
TLS Fingerprint	JA3/JA4 patterns and cipher behaviour
HTTP Behaviour	Header ordering and User-Agent consistency
Request Timing	Burst patterns and think-time distribution
JS Challenge	Canvas and WebGL anomalies

Signal Group	What It Detects
IP Reputation	ASN class and abuse history
Session Graph	Page visit sequences and referrer chains
Payload Analysis	Form fill timing and parameter patterns

GlassBox automatically detects when two signals together are suspicious even if each one alone appears benign — catching advanced bots and new DDoS variants.

When new attack patterns appear, GlassBox learns directly from the traffic and strengthens your rules — keeping your Zero Trust and WAF protection current.

5. CrowdStrike – Endpoint Detection & Response

CrowdStrike Falcon processes endpoint telemetry from thousands of organisations. The highest-stakes problem is that a wrong block can stop production systems, while a missed detection lets ransomware through.

How GlassBox helps

Signal Group	What It Detects
Process Lineage	Parent-child chains and injection attempts
File System	Ransomware encryption patterns
Network Egress	C2 communication and exfiltration
Registry	Persistence mechanisms
Memory	In-memory execution and shellcode
User Context	Privilege escalation and lateral movement

Your analysts see exactly which endpoint signals caused an isolation decision. Cross-signal detection catches injection techniques that look normal in one area but anomalous in another.

When a tenant sees repeated false positives (e.g., in CI/CD pipelines), GlassBox learns from those specific incidents and adapts the model for that environment — without affecting other customers.

6. Palo Alto Networks & SentinelOne – SOC & Threat Intelligence

In XSIAM and Singularity platforms, the challenge is turning thousands of alerts into actionable incidents and keeping threat intelligence current.

How GlassBox helps

For Palo Alto Cortex XSIAM

GlassBox adds clear attribution to every correlated incident. Your L1 analysts see which signal groups drove the classification — so they can contain threats faster without escalating every case.

For SentinelOne Singularity

GlassBox automatically discovers behavioural sub-patterns and builds a living taxonomy of threats. Your threat intelligence team gets fresh, accurate insights without manual curation.

7. Compliance-Grade Explainability

GlassBox meets the strictest regulatory requirements because every decision is exactly reproducible and fully documented.

Regulation	Requirement	How GlassBox Helps
GDPR Art. 22	Explain automated decisions	Exact signal attribution per decision
SOC2 Type II	Documented rationale for controls	Complete audit trail with every explanation
FedRAMP / HIPAA	Auditable access decisions	Reproducible evidence from model weights
NIS2	Causal analysis of incidents	Clear signal-level breakdown for every incident

8. Flexible Signal Design – Choose Your Level of Detail

You decide how detailed the explanations should be. GlassBox works at any level you choose.

Simple Mode

Use 3–4 signals for fast, high-volume triage (ideal for edge filtering or basic bot detection).

Standard Mode

Use 5–7 signals for balanced SOC triage — the sweet spot for most enterprise deployments.

Detailed Mode

Use 8+ signals for deep forensic analysis and compliance reporting.

The same core platform adapts to all three modes. Your team chooses the right level of detail for each use case — no code changes required.

9. Automatic Adaptation & Targeted Synthetic Data

When your models encounter new threats or environment changes, GlassBox learns directly from real incidents and strengthens protection automatically.

Traditional Methods	GlassBox Approach
Manual retraining or blind augmentation	Learns only from actual failures in your environment
Generic synthetic data	Targeted generation focused on the exact signals that failed
Long cycles involving security teams	Fast, automated improvement with no extra labelling

10. Why GlassBox Stands Apart

Capability	Traditional AI	Post-hoc Tools	GlassBox
Per-decision explanation	No	Approximate	Exact & reproducible
Cross-signal attack detection	No	No	Built-in
Automatic adaptation from incidents	No	No	Yes
Compliance-ready audit trails	No	No	Yes
Flexible signal design	No	No	Yes

11. Ready to See GlassBox in Your Environment?

GlassBox transforms your security AI from a black box into a trusted partner. Your analysts get clarity, your compliance team gets proof, and your models stay ahead of evolving threats — all while working seamlessly with your existing platforms.
